Abstract

The purpose of this paper is to make a study of how the characteristics of height, weight, retirement age, period of service and positions differ according to the selections by round and where they played at the time of the draft selection.
 One thousand eight hundred ninety-one (949 pitchers, 942 position players) retired players who had been drafted from 1965 to 2003 were selected for this study.
 The results of the survey are summarized below:
 (1) At the time of the draft selection, 50.6 percent of all the drafted players were high school graduates, 22.5 percent were high school graduates who played in the industry league, 17.2 percent were four-year college graduates and 9.7 percent were four-year college graduates who played in the industry league.
 (2) The average period of service as a professional player for those players who had experience in the major leagues was 9.61 years. On the other hand, the average period of service for those who had no experience in the major leagues was 4.02 years, which makes a difference of 5.6 years.
 (3) The positions of the drafted players were; pitchers (53.8%), catchers (11.1%), infielders (20.9%), outfielders (14.2%).
